CASE

A 5-day-old girl, born at term after an uncomplicated pregnancy, was admitted to the hospital after a routine midwife check showed that she had lost 15% of her original birth weight [6.2 lb (2.83 kg)]. She was being fed normal-term formula milk, and an initial assessment revealed only mild dehydration. The working diagnosis was a feeding problem, and her management plan was to be fed 150 mL/kg formula milk per day with regular monitoring of weight. The patient’s serum concentrations of selected analytes were as follows: sodium, 135 mEq/L (135 mmol/L; reference interval, 135–145 mmol/L); potassium, 5.3 mEq/L (5.3 mmol/L; reference interval, 3.5–5.3 mmol/L); and urea, 11.7 mg/dL (4.2 mmol/L; reference interval, 3.5–6.5 mmol/L).

Five days after admission, the patient’s weight was unchanged. Her serum analyte concentrations were now as follows: sodium, 128 mEq/L (128 mmol/L); potassium, 6.7 mEq/L (6.7 mmol/L); urea, 5.8 mg/dL (2.1 mmol/L); creatinine, 0.3 mg/dL (28 µmol/L; reference interval, 60–100 µmol/L); and blood glucose, 77.4 mg/dL (4.3 mmol/L). These results yielded an anion gap of 10.7 mmol/L. The urine sodium concentration was 10 mEq/L (10 mmol/L). Further blood results were available 2 days later: plasma renin, 854 mIU/L (reference interval, 4–190 mIU/L in 7 days to 1 year); serum aldosterone, 5786 ng/L (reference interval, 300–2000 ng/L in neonates). The results of blood gas, serum cortisol, ammonia, lactate, urine culture, and urine steroid profile tests were all normal.

Questions to Consider

• What are common causes of excess weight loss in a neonate who presents in the first few days of life?

• What are the possible explanations for hyponatremia with hyperkalemia in a neonate with excessive weight loss?

• What laboratory investigations are appropriate?
Final Publication and Comments
The final published version with discussion and comments from the experts will appear in the February 2013 issue of *Clinical Chemistry*. To view the case and comments online, go to http://www.clinchem.org/content/vol59/issue2 and follow the link to the Clinical Case Study and Commentaries.

All previous Clinical Case Studies can be accessed and downloaded online at http://www.aacc.org/resourcecenters/casestudies/.

Educational Centers
If you are associated with an educational center and would like to receive the cases and questions 1 month in advance of publication, please email clinchem@aacc.org.

AACC is pleased to allow free reproduction and distribution of this Clinical Case Study for personal or classroom discussion use. When photocopying, please make sure the DOI and copyright notice appear on each copy.

AACC is a leading professional society dedicated to improving healthcare through laboratory medicine. Its nearly 10,000 members are clinical laboratory professionals, physicians, research scientists, and others involved in developing tests and directing laboratory operations. AACC brings this community together with programs that advance knowledge, expertise, and innovation. AACC is best known for the respected scientific journal, *Clinical Chemistry*, the award-winning patient-centered web site *Lab Tests Online*, and the world’s largest conference on laboratory medicine and technology. Through these and other programs, AACC advances laboratory medicine and the quality of patient care.
